AUTO TICKET CLASSIFICATION USING FLOW DESIGNER

PHASE 7 – PROJECT DOCUMENTATION

ServiceNow • Flow Designer • School IT Helpdesk

Purpose – A clear, reusable record of the completed project, including overview, objectives, implementation, testing outcome, deployment/update-set procedure, and conclusion.

7.1 Project Overview

The school IT helpdesk receives multiple incident requests such as Wi-Fi issues, projector failures, password problems, and slow computers. The project automates ticket classification using ServiceNow Flow Designer by analyzing keywords in the Short Description and Description fields.

7.2 Project Objectives

• Automatically classify incidents at creation.

• Reduce manual effort for IT agents.

• Improve ticket routing efficiency.

• Provide a no-code and easily maintainable solution.

7.3 Implemented Solution

• Custom Incident Workflow table stores ticket records.

• Required fields include Number, Caller, Category, Subcategory, Short Description, Description, State, Assigned Group, and Assigned to.

• Category and Subcategory use dependency logic.

• Flow Designer applies keyword-based conditions.

• Email notification is sent to the caller after ticket creation/classification.

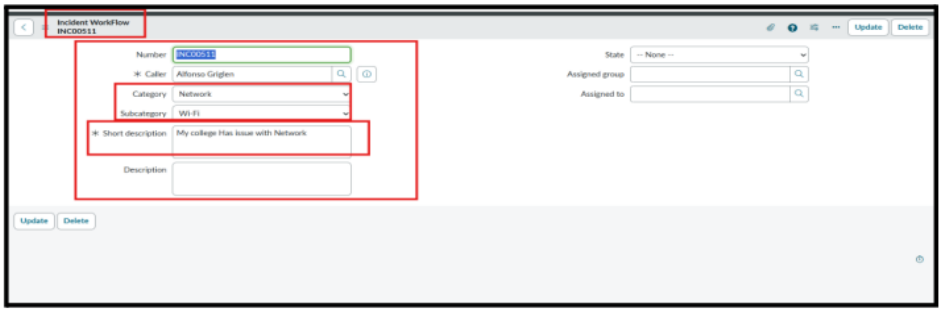

7.4 Classification Logic

Keyword / Issue	Category	Subcategory
WiFi / Network	Network	WiFi
Projector	Hardware	Projector
Password / Login	Access	Forgot Password
Slow / Hanging	Performance	Slow Computer

7.5 Testing Evidence

The project records successful test cases for Wi-Fi and projector issues, including automatic classification and caller email notification.

- Then it fills auto as :
- Category → **Network.**
- Subcategory → **WiFi.**
- Email sent to caller Email Id.

Activity : 2 Check Email Notification.

- Open All menus → Search Emails.
- Under System logs → Select Emails.
- Search with the Given Subject Name.
- Open that Record and Under Related Links Click Preview mail Option.

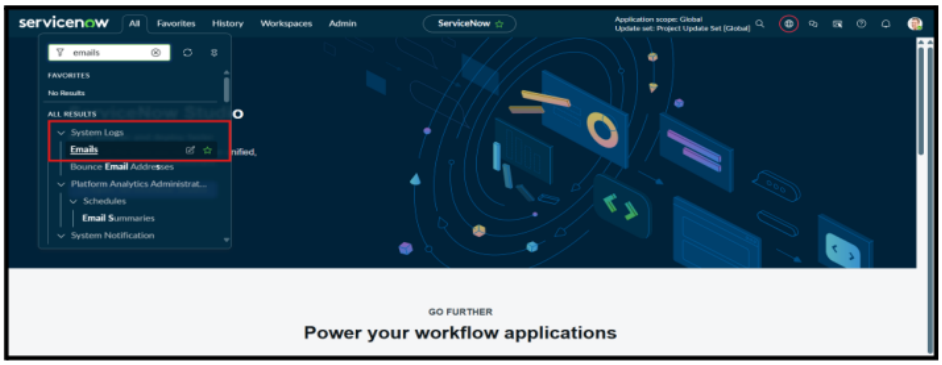

Figure 7.1 – Testing evidence

7.6 Deployment / Update Set Documentation

• Open All menus → Search for Local Update Sets.

• Under System Update Sets, select Local Update Sets.

• Open the Project Update Set.

• Change State from In progress to Complete.

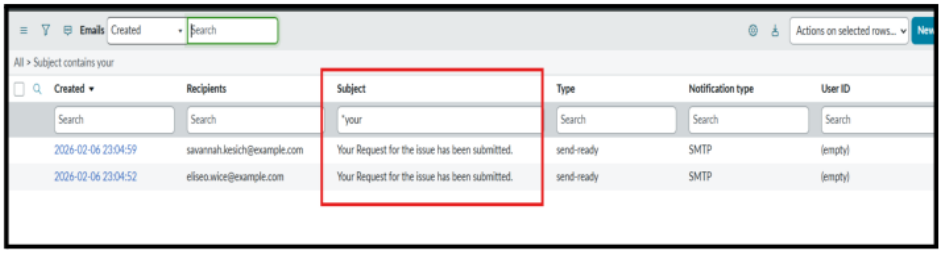

• Save the form.

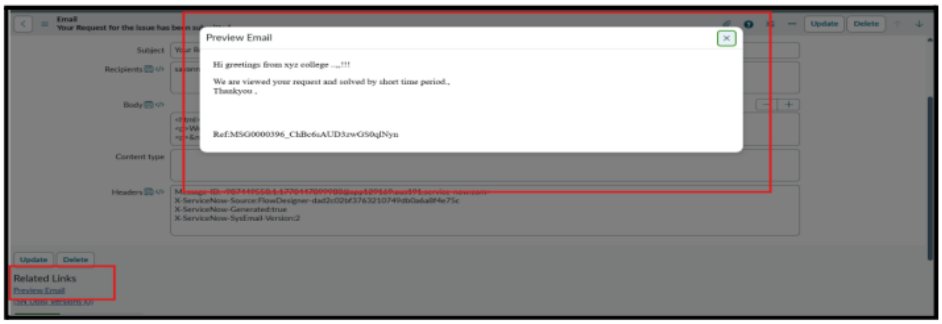

• Select Export to XML under Related Links.

• The Update Set data is downloaded in XML format and can be shared for transfer to another environment.

7.7 Email Notification

After classification, Flow Designer sends an email to Caller → Email. The configured subject is “Your Request for the issue has been submitted.” The body contains the ticket confirmation message.

Activity : 3 Test Scenario 2

- Enter one Caller Name.
- Short Description: Projector not turning on.
- Then Save the Form.
- And Reload the Form.
- Then it fills auto as :
- Category → **Hardware.**
- Subcategory → **Projector.**
- Then Email sent to caller Mail id.

Figure 7.2 – Email notification evidence

7.8 Maintenance & Future Scope

The solution is described in the source project as easy to maintain, scalable, and completely no-code. Future extensions identified include assignment automation, SLA tracking, and predictive intelligence.

7.9 Final Conclusion

The Auto Ticket Classification using Flow Designer project provides an end-to-end automation solution for a school IT helpdesk. It reduces manual categorization effort, improves ticket routing, uses dependent choice fields for data consistency, and provides immediate email acknowledgement. The phased implementation supports clarity, stability, and maintainability, while testing and validation confirm reliable operation for the documented scenarios.

7.10 Project Reference Evidence

Conclusion

- The **Auto Ticket Classification using Flow Designer** project successfully delivers a complete, end-to-end automation solution for a school IT helpdesk. The primary objective of reducing manual effort in ticket categorization and improving response efficiency has been fully achieved.
- Through structured requirement analysis, careful backend configuration, and no-code automation using Flow Designer, the system now automatically classifies IT tickets based on the short description provided by students. The implementation of dependent choice fields ensures data accuracy, while automated email notifications improve communication by instantly acknowledging ticket creation to the caller.
- The solution was developed using a phased approach, ensuring clarity, stability, and ease of maintenance. Comprehensive testing and security validation confirmed that the system functions reliably, maintains data integrity, and enforces appropriate access controls.
- Overall, this project demonstrates how ServiceNow can be effectively used to build scalable, maintainable, and user-friendly automation solutions without relying on complex scripting or machine learning. The design is well-suited for small to medium environments such as educational institutions and can be easily extended in the future to include advanced features like assignment automation, SLA tracking, or predictive intelligence.
